#### MULTIPLE SHOCKS AND CHANGES IN THE DEVELOPMENT GRADIENT OF CROATIA'S REGIONS

Paper written for Unidea/LEED seminar Regional diversity and local Development in Central and Eastern Europe

Warsaw 10 November 2006 Ivo Bićanić and Vedrana Pribičević Faculty of Economics, University of Zagreb The Croatian economy has been exposed to multiple shocks

- Transformation 1989-ongoing?
- Independence 1991
- Homeland war 1991-1995
- EU integration 2003-?

#### The shocks

- overlap (never only one)
- include social engineering and intended results
- involve unintended results (often pathologies)
- exogenous and endogenous (including conditionality)

Shocks should have had a major spatial impact each by itself

- transformation and 40 year socialist legacy
- independence and new border regions
- war and displaced persons, refugees war zones
- integration and new rules or redistribution
- together due to interdependencies effects increased (rarely counteract each other)

## Difficult to unbundle regional influence

Overlapping

due to interdependence

lack of data

## How did the shocks influence

## spatial inequality

- internal development gradient
- Croatian on the European development gradient

#### Stylized fact:

- 1. major increase and divergence
- 2. increased lags

Measuring change: time period

- 32 year period 1971-2003
- two fifteen year period
  - 1 socialist regional development, 1971-1998
  - 2 effects of shocks, 1998-2003

three year averages 1971-1973, 1996-1998 and 2001-2003

## Measuring change: data problems

- changing boundaries, recalculating all data to fit current county boundaries (21 points)
- variable 1 regional social product and gross national income
- variable 2: regional social product p/c and gross national income p/c
- More complex indices may be better but cannot be constructed for whole period

## Results of measurement 1:

Table 7: Changes in regional inequality during 40 years of socialist development in Croatia Inequality measures of regional disparities

| 1 5   |                                 |                                 |                                 |  |  |  |
|---|---------------------------------|---------------------------------|---------------------------------|--|--|--|

| Range of per capita<br>social product<br>(min as % of<br>max)               | 0,224676426                     | 0,240697183                     | 0,327795077                     |  |  |  |
| Normalized range of<br>per capita social<br>product (                       | 1,682126983                     | 1,241809517                     | 1,35567826                      |  |  |  |
| Inequality index  |                                 |                                 |                                 |  |  |  |
| Source: own calculation from statistical Yearbook of Croatia, various years |                                 |                                 |                                 |  |  |  |

## The data:

- continuous increase of inequality of the gross income distribution
- continuous decrease of inequality of per capita income
- changes during First Period larger than during Second Period
- during second period small changes contrary to stylized fact

#### Results of measurement 3: Croatia's lag

| Table 11: Croatian per capita income as percent of Slovenian and Austrian               |                               |                               |                               |                               |                                    |                     |

# Human Development Indicators, World Bank 2004

### The data:

- continuous deterioration during whole period
- slow deterioration during First Period
- major increase of lag during Second Period

## Interpreting changes (No reliable research results available)

- transformation induced restructuring
- postponed restructuring, slow reformer
- war effects, post war reconsutruction
- no policy effects (no regional policy 1991-2002)
- extensive migration, internal and external

## Redistribution of income from developed to less developed

during socialist period: Insufficiently Developed Areas

after 2000 Areas of Special State Concern

# Table: Regions eligible for support

| Table 10: Regional funds revenue                           |                        |                       |  |  |
|--|------------------------|-----------------------|--|--|

## Changes in areas:

Picture 3: Insufficiently developed areas 1986

# Changes in areas

Picture 4: Areas of special state concern 2002

## The real changes and perceived changes:

- Is the stylized fact correct?
- Have there been major changes in the gradient?
- Other aspects of the inequality issue:
- distribution of income (economic inequality)
- poverty and perceptions
- distribution of wealth
- Problems of equity
